

SUMMIT – Performance Never Felt Better

The Summit XC4 is a high-end EN B wing that is very easy to fly, and even more to the point, it is a wing that is very easy to fly far on. The handling of the wing is closely related to that of our popular high-end EN C wing, the Trango XC3, and this means that it will communicate even better, letting its pilot know precisely what is going on where, but without feeling nervous in the process. The glide at high speeds, so critical for into-wind performance on long XC flights, has been further improved compared to the Summit XC3, and with the light and efficient speed system and the very stable aerofoil there is simply no reason to hang around – just get on that bar and mash it, comfortable in the knowledge that you can control any little surge with the C-handles even before they turn into proper surges.
